Solar activity ranged from very low to moderate levels. Very low levels occured on 07 Nov. Low levels were observed on 03-06 Nov. Moderate levels were reached at 01/0145 UTC due to an M1/1f flare from Region 2887 (S25, L=278, class/area Dki/440 on 24 Oct). Associated with this flare were Type-II (626 km/s) and Type-IV radio emmisions. A CME was observed by SOHO/LASCO C2 imagery at 01/0200 UTC. Region 2887 also produced a CME, off the SW limb, at 01/1824 UTC from a long duration C1 flare at 01/1801 UTC. This was followed by what appeared to be a double CME event off the W and SW limb at 01/2124 UTC associated with a C4/Sf flare at 01/2133 UTC. Moderate levels were again reached at 02/0301 UTC due to a long duration M1/1f flare from Region 2891 (N17, L=212, class/area Dki/350 on 29 Oct). Associated with this flare were a 10 cm radio burst (110 pfu) and a halo CME, first observed in SOHO/LASCO C2 imagery, at 02/0248 UTC. WSA ENLIL modeling of these multiple CME events from 01-02 Nov showed an Earth-directed component with an estimated arrival on 04 Nov.

The greater than 10 MeV proton flux at geosynchronous orbit remained elevated above background levels near 2-3 pfu on 01-03 Nov due to persistent effects from the X1/2n flare on 28 Oct. It nearly reached S1 (Minor) levels late on 03 Nov with the arrival of the 01 Nov CME(s). Proton flux returned to background levels on 04 Nov and remained there throughout the remainder of the reporting period.

The greater than 2 MeV electron flux at geosynchronous orbit reached high levels on 05-07 Nov in response to the 01 Nov CME(s). Moderate levels were observed on 01-04 Nov.

Geomagnetic field activity reached active levels on 01-02 Nov due to influence from a positive-polarity, northern crown extention CH HSS. Total field increased to a maximum of 15 nT at 01/1953 UTC followed by an increase in solar wind speed from approximately 335 km/s to near 630 km/s. The Bz component was between +15/-12 nT and the phi angle was mostly oriented in a positive sector. The geomagnetic field returned to quiet levels on 03 Nov as HSS conditions slowly waned. Solar wind speeds were steady near 520 km/s and Bt was less than 5nT. A sudden impulse was observed at 03/1957 UTC with a deviation of 21nT measured at the FRD magnetometer in response to the shock arrival of the 01-02 Nov CME(s). Geomagnetic field levels escalated to G1-G3 (Minor-Strong) storm conditions on 03-04 Nov in response. Solar wind speed increased from approximately 520 km/s to near 770 km/s. Total field increased to a maximum of 23 nT at 03/0648 UTC while a prolonged period of southward Bz of -12 to -18 nT was observed between 04/0430-0830 UTC. Active conditions were observed on 05-07 Nov as CME effects waned.

Space Weather Outlook 08 November - 04 December 2021

Solar activity is expected to be very low with a chance for C-class flaring on 08-15 Nov and

01-04 Dec. Solar activity is expected to be at low levels with a chance for M-class flare activity on 16-30 Nov due to the return of Region 2887.

No proton events are expected at geosynchronous orbit.

The greater than 2 MeV electron flux at geosynchronous orbit is expected to reache high levels on 08-09 Nov due to persistent CME effects. Normal to moderate levels are anticipated 10 Nov - 04 Dec.

Geomagnetic field activity is expected to reach active levels on 15, 28-29 Nov in response to recurrent CH HSS influence. Quiet to unsettled levels are expected for the remainder of the outlook period.

#### Preliminary Report and Forecast of Solar Geophysical Data (The Weekly)

Published every Monday by the Space Weather Prediction Center.

U.S. Department of Commerce NOAA / National Weather Service Space Weather Prediction Center 325 Broadway, Boulder CO 80305

**Notice:** The 27-day Outlook, Satellite Environment, X-ray and Proton plots have been redesigned. Comments and suggestions are welcome SWPC.Webmaster@noaa.gov

The Weekly has been published continuously since 1951 and is available online since 1997.
